

INTERPRETING LARGE SCALE NATIONAL LEVEL ASSESSMENT DATA IN MATHEMATICS BY USING RASCH ANALYSIS

Pavels Pestovs¹, Namsone Dace¹

¹University of Latvia, Latvia

14th International Scientific Conference, SIE,
22nd May, 2020

Context in Latvia

The proportion of students in Latvia, who can solve complex problems is on average lower than on average in OECD countries (OECD, 2016)

Revised Curriculum reform, where competence is defined as a result (Cabinet of Ministers, 2018)

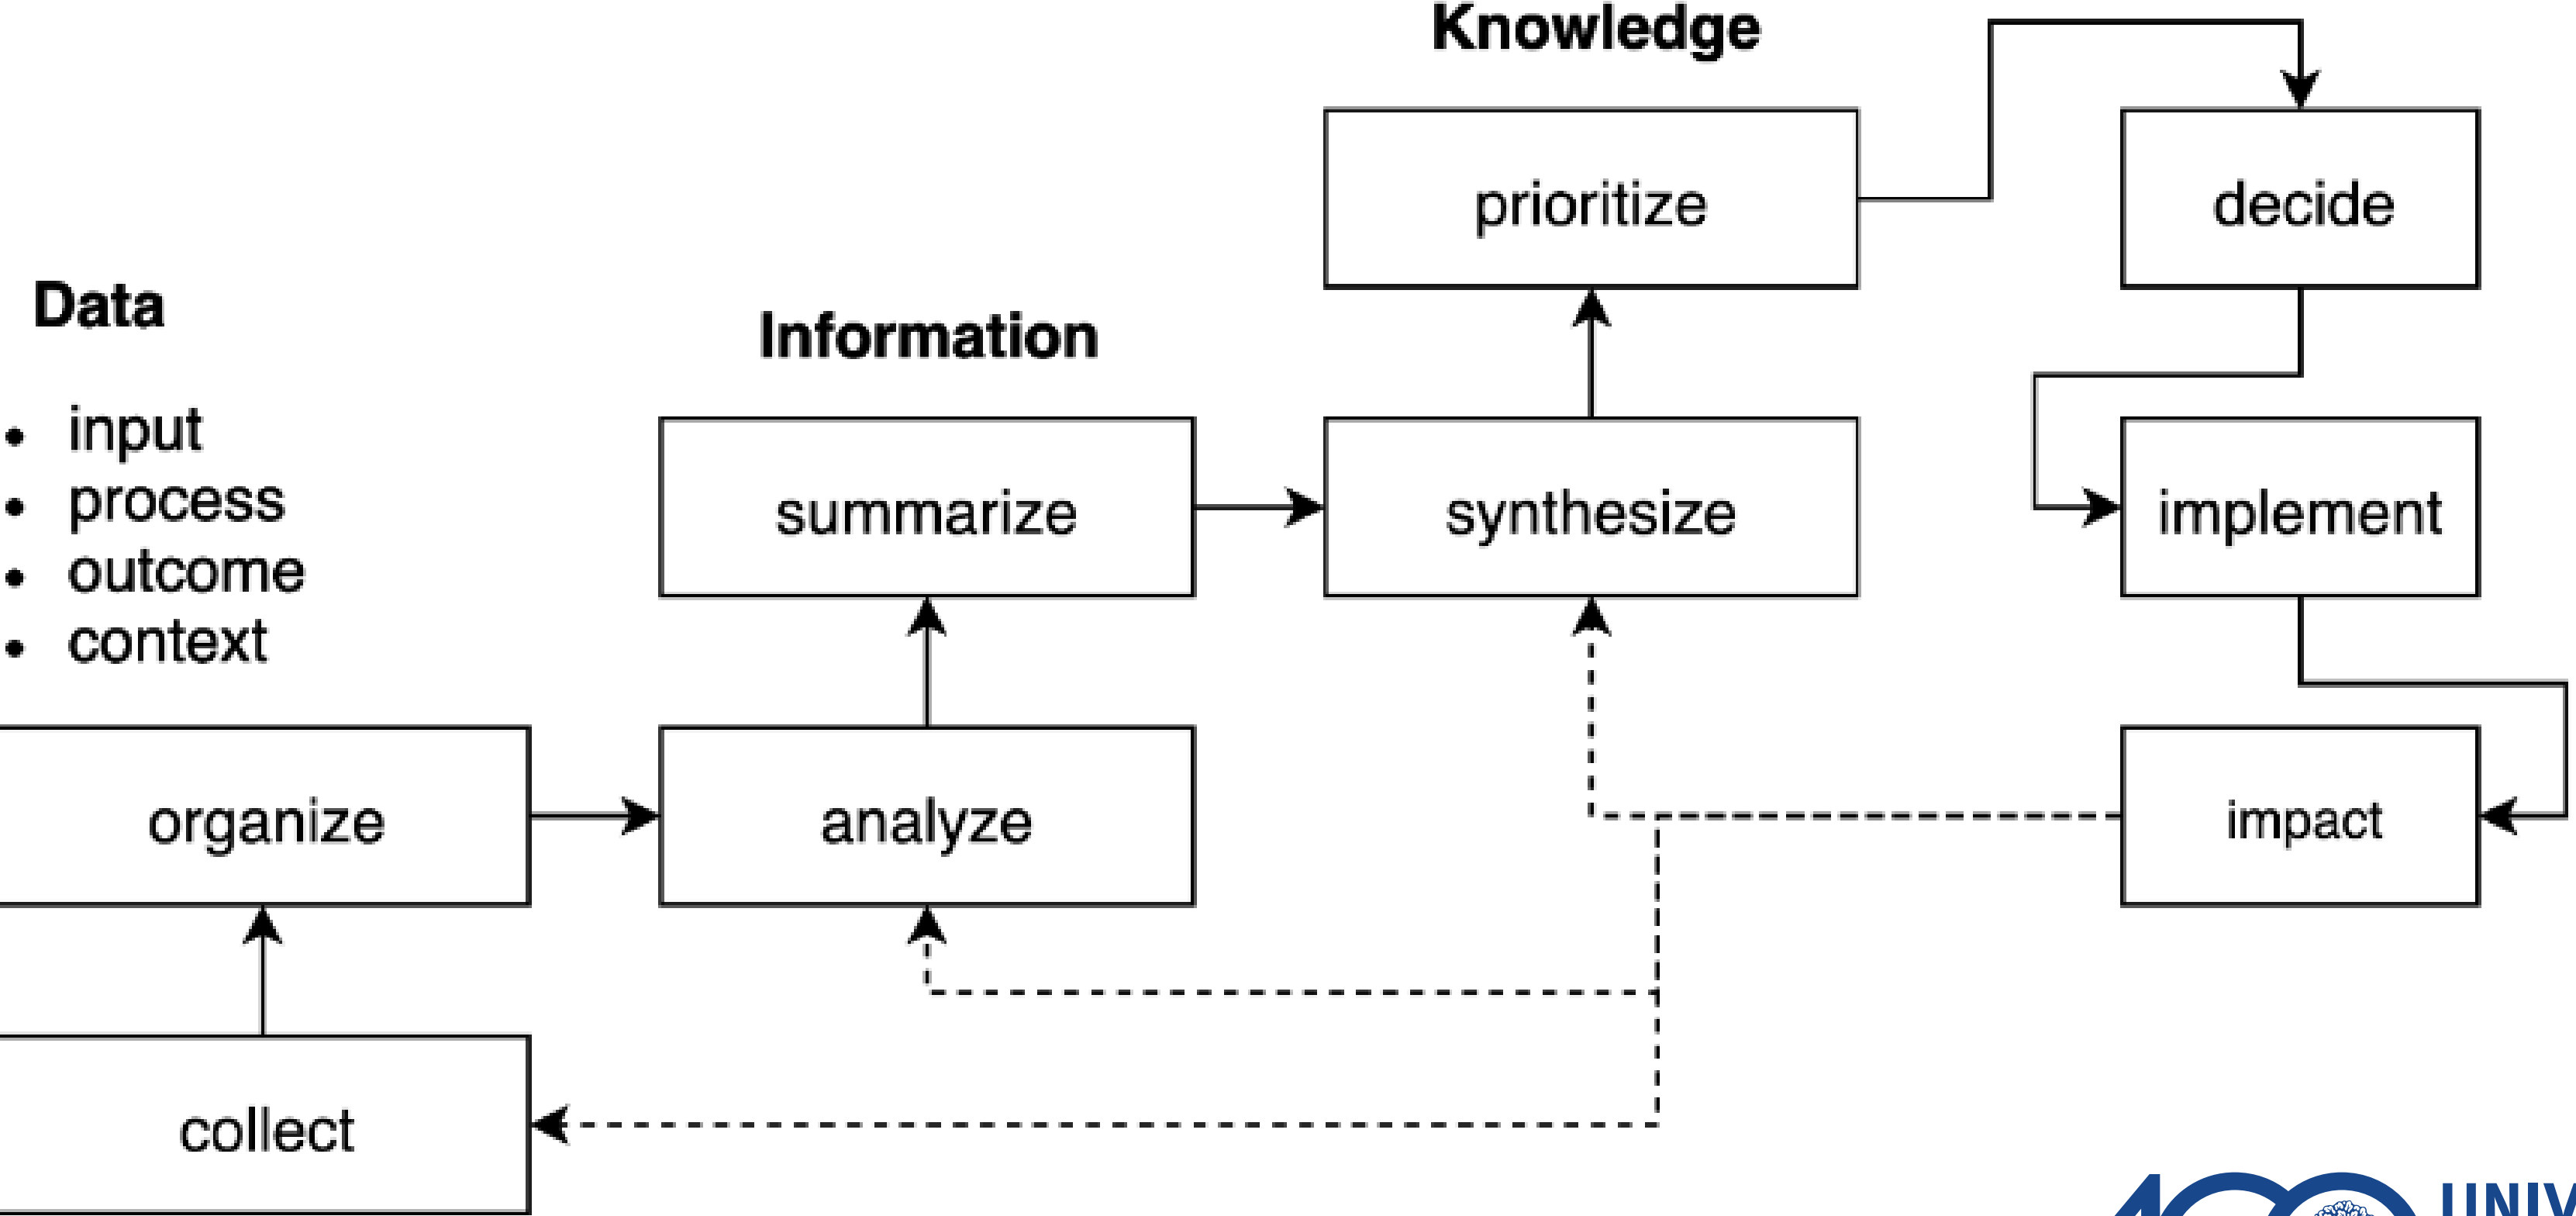

School as Learning Organization (Kools, Stoll, 2016)

Data-Driven Decision Making (Mandinach et al., 2018)

Integrated Models of The School as Learning Organization

- shared vision on the learning of all students;
- learning opportunities for all staff;
- collaboration among all staff;
- culture of inquiry;
- learning with and from the external environment;
- Learning leadership;
- collecting and exchanging knowledge.

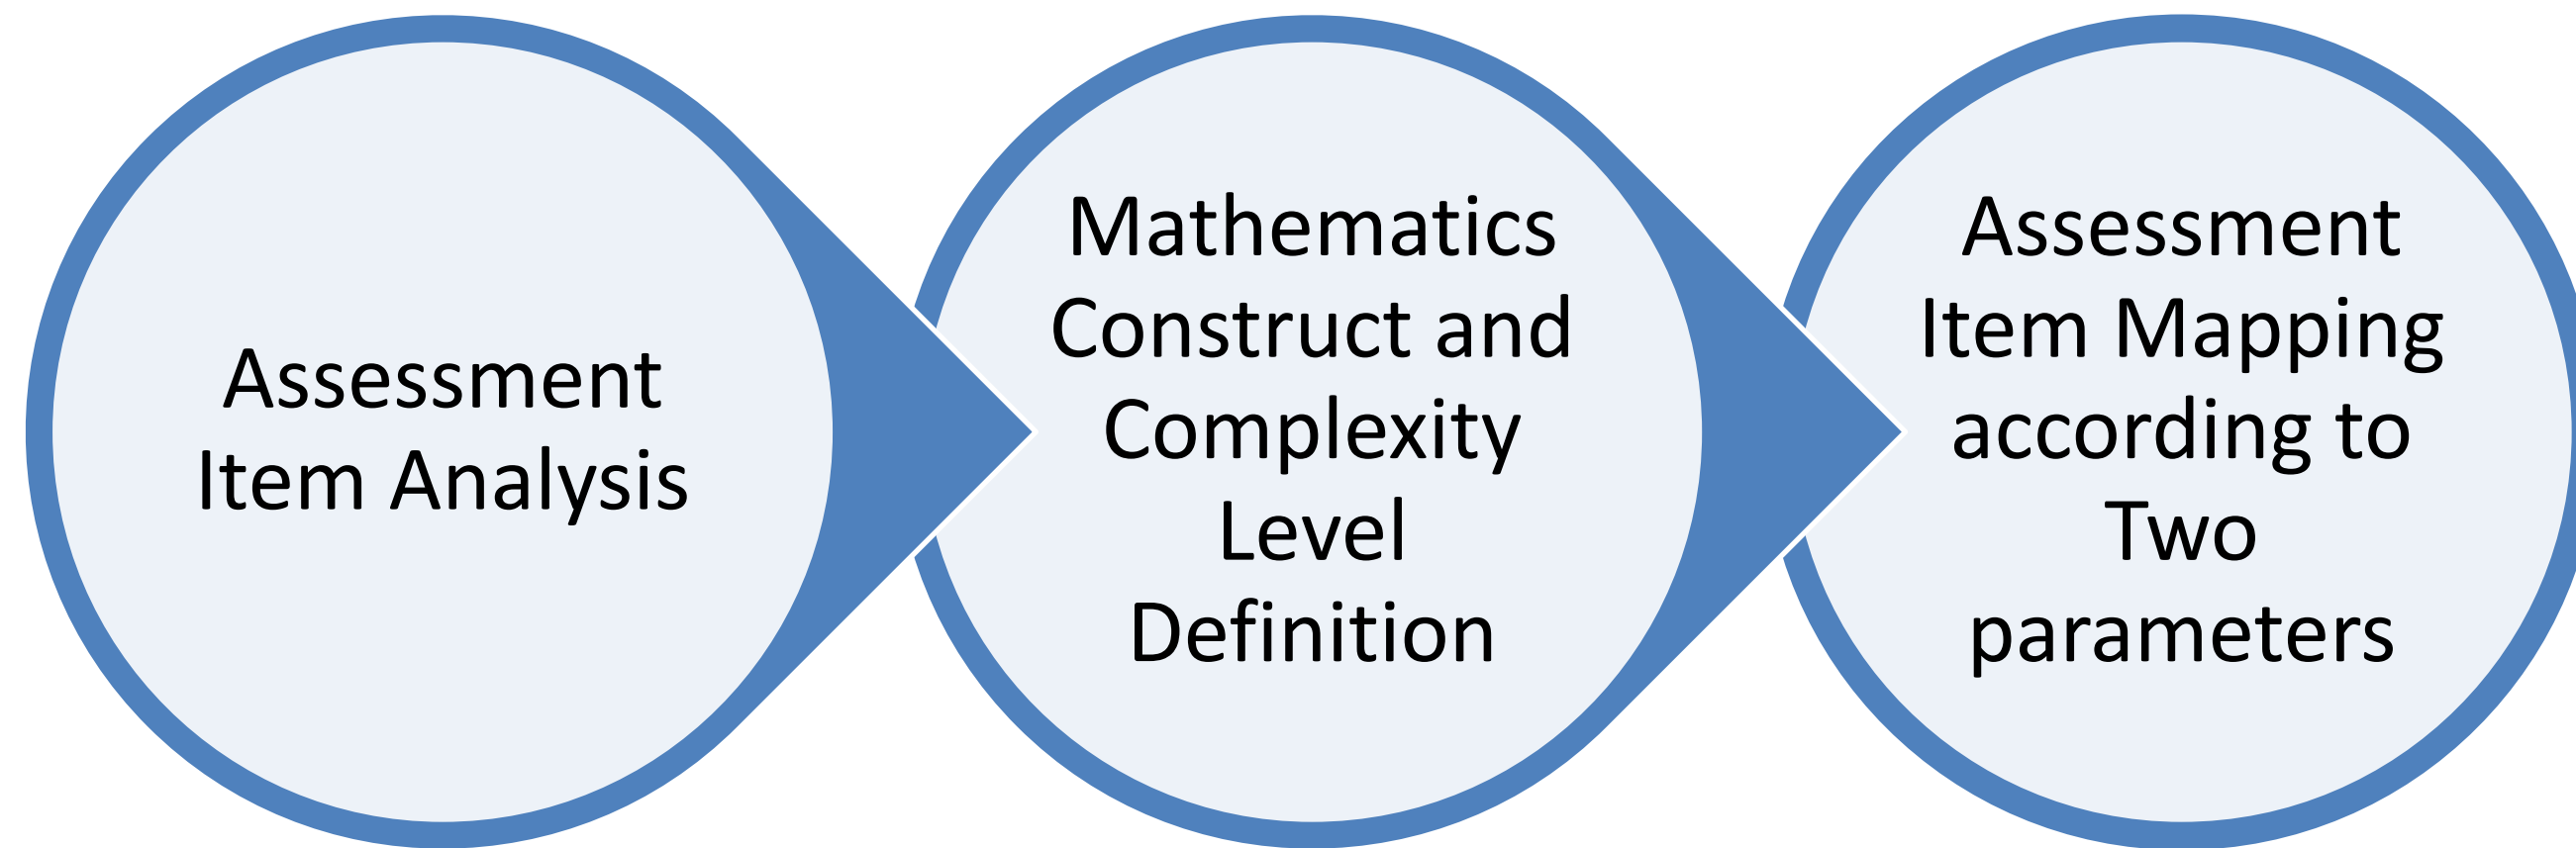

Data-Driven Decision Making

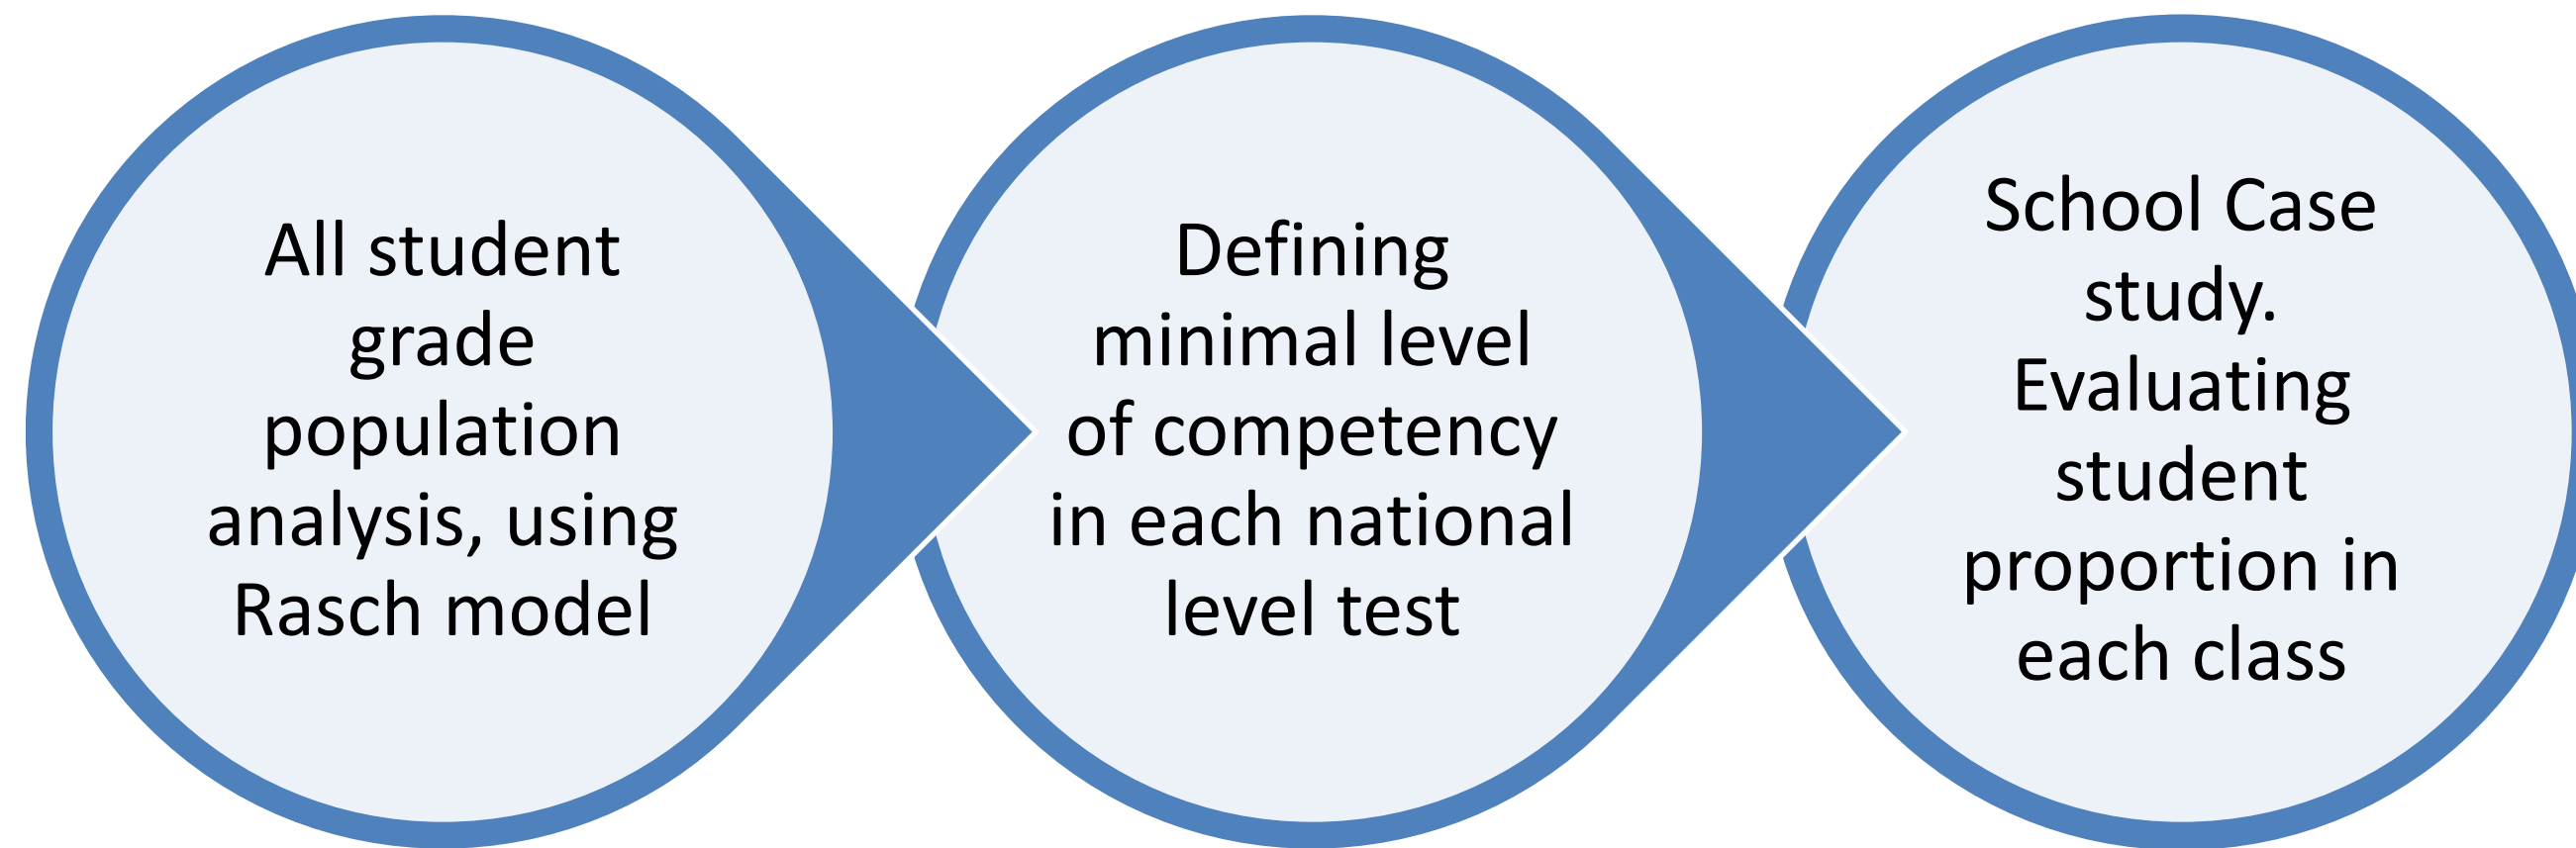

Research Questions

1. What learning outcomes have been measured in 3rd, 6th and 9th grade national level tests?
2. How is it possible meaningful data interpretation, using *Rasch* model?

Methodology (1)

Methodology (2)

RESULTS

Mathematics construct substrands

| Construct | Construct Substrands |
|-------------|-------------------------------------|
| Mathematics | Numbers and operations with numbers |
| | Data analysis |
| | Reasoning |
| | Knowledge and Understanding |

3rd Grade National Level Large Scale Assessment Item Mapping According to Mathematics Literacy Construct Substrands

| Construct Categories | Level 1 | Level 2 | Level 3 | Level 4 |
|-------------------------------------|-------------------------------|---|-----------|---------|
| Numbers and operations with numbers | 7.1. | 1., 3., 4., 5., 6., 7.3.,7.5.,7.7.,7.9. | | |
| Data analysis | 7.2., 7.4., 7.6., 7.8., 7.10. | | 8.5.,8.6. | |
| Reasoning | | 2.1., 2.2., 2.3. 2.4. | | |
| Knowledge and Understanding | | | | |

Case study

| National Level Test | 3rd grade | 6th grade | 9th grade |
|------------------------|---|---|--|
| Item assessment number | 2.1., 2.2., 2.4., 1.1., 1.3., 7.1., 1.4., 4.1., 5.1., 8.1., 5.2., 6.2.1., 6.2.2., 6.2.3., 8.2. | 1.1., 2.1., 3.2., 2.5., 1.2., 2.2., 3.1., 2.4., 2.6. | 2.3.2., 2.8.1., 1.1., 2.3.3., 1.6., 2.3.1., 1.4., 1.16., 1.15., 1.10., 1.17., 1.7. |
| Student number | 53 | 48 | 71 |
| Student proportion | 3,8 % | 18,8 % | 12,7 % |

Conclusions

Different national level tests are defined differently according to the construct of mathematics, that's why it is not possible to interpret data without additional data analyses.

In case study the proportion of students who have not reached minimal mathematics competency level

Limitation of the study is an insufficient number of test items with high complexity level and reliability issues, because of marking procedures in the schools.
